

Project Design Phase

Solution Architecture

Date	31 July 2026
Name	D. Venkata Charan Teja
Project Name	Automated Network Request Management
Maximum Marks	4 Marks

Solution Architecture:

The proposed solution architecture automates the corporate network request process using the ServiceNow platform. Users submit a network request through the Service Catalog by providing required details such as device type, connection type, address, and requester information. The submission triggers a Flow Designer workflow that automates approvals, notifications, and backend record management.

The workflow first sends an assignment email to the System Administrator for review. Based on the approval decision, the system follows one of two execution paths. If approved, the workflow inserts the request into the custom u_network_database table and sends an approval notification to the requester. If rejected, the requester receives a rejection email with the request status.

This architecture minimizes manual intervention, standardizes the approval process, improves data accuracy, and enables faster processing of network resource requests while maintaining complete traceability and auditability.
