

Project Design Phase
Proposed Solution Template

Date	31 July 2026
Name	D. Venkata Charan Teja
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Proposed Solution Template:

The proposed solution is to develop an **Automated Network Request Management System** using the **ServiceNow** platform to automate the complete lifecycle of network-related service requests. The system provides a centralized, standardized, and user-friendly platform where employees can submit network service requests such as VPN access, firewall changes, IP address allocation, network connectivity support, and network access permissions.

Instead of relying on manual communication methods such as emails, phone calls, or spreadsheets, the proposed system digitizes and automates the entire request process. Users can submit requests through the **Service Catalog**, where dynamic forms capture all the required information. Based on predefined business rules and workflows, ServiceNow automatically routes requests to the appropriate approval authorities and assigns tasks to the responsible network support teams.

The solution incorporates **workflow automation** using **Flow Designer**, enabling automatic approvals, task creation, notifications, and request tracking. Email notifications keep both requesters and technicians informed about request progress, approvals, rejections, and completion status. The system also supports document attachments, validation rules, and priority-based task assignment to ensure accurate and efficient request processing.

A centralized database stores all request information, making it easier to monitor request history, generate reports, and analyze service performance. Managers can track request status in real time using dashboards and reports, improving visibility and enabling better decision-making. The solution also maintains audit logs and approval records to ensure compliance with organizational IT governance and security policies.

By implementing this automated solution, organizations can significantly reduce manual effort, minimize processing delays, eliminate human errors, standardize network service delivery, and improve collaboration among IT teams. The result is a faster, more transparent, secure, and efficient network request management process that enhances both operational productivity and end-user satisfaction.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Corporate network resource requests are often managed manually through emails and spreadsheets, resulting in approval delays, communication gaps, data entry errors, and lack of centralized tracking.
2.	Idea / Solution description	Develop a ServiceNow-based automated workflow that enables users to submit network resource requests through the Service Catalog. The system triggers Flow Designer for approval processing, automatically inserts approved records into the u_network_database , and sends approval or rejection email notifications.
3.	Novelty / Uniqueness	The solution integrates Service Catalog, Flow Designer, automated approvals, database updates, and email notifications into a single workflow, eliminating manual intervention and providing end-to-end automation with real-time tracking.
4.	Social Impact / Customer Satisfaction	The system reduces processing time, minimizes human errors, improves transparency, enhances user experience, and increases employee satisfaction by providing a faster and more reliable request management process.
5.	Business Model (Revenue Model)	The solution can be deployed as an enterprise workflow automation service within organizations using the ServiceNow platform. It reduces operational costs, improves IT productivity, and delivers value through process automation rather than direct customer sales.
6.	Scalability of the Solution	The solution is highly scalable and can support multiple departments, branch offices, and thousands of users. Additional request types, approval levels, integrations, and workflows can be incorporated without major architectural changes using the ServiceNow platform.
