

## Flow Testing

# Flow Testing

## Objective

The purpose of flow testing is to verify that the Network Request workflow executes correctly whenever a user submits a request through the Service Catalog. The testing ensures that all actions, conditions, approvals, record updates, and notifications are performed as expected.

## Test Environment

- Platform: ServiceNow Personal Developer Instance (PDI)
- Application: Global
- Module: Service Catalog
- Catalog Item: Network Request
- Flow Designer: Network Request Flow

## Test Procedure

### Test Case 1: Submit Network Request

## Objective

**Verify that a new request triggers the flow automatically.**

### Steps

1. Navigate to Service Catalog.
2. Open the Network Request catalog item.
3. Fill in all the required details.
4. Click Order Now or Checkout.
5. Verify that the request is created successfully.
6. Open Flow Designer → Executions and verify that the flow has started.

### Expected Result

- Flow execution starts automatically.
- Catalog variables are retrieved successfully.
- A record is created in the Network Database table.
- An email notification is generated.
- Approval request is sent to the approver.

## Test Case 2: Approval Process

### Objective

Verify that the approval action works correctly.

### Steps

1. Open the approval request.
2. Approve the request.
3. Wait for the flow to continue.

### Expected Result

- Approval state changes to Approved.
- The approval condition evaluates to True.
- The remaining flow actions execute successfully.

## Test Case 3: Update Record

### Objective

Verify that the database record is updated after approval.

### Steps

1. Open the created Network Database record.
2. Check the updated fields.

### Expected Result

- Assigned To field is updated.
- Work Status changes to Work In Progress.
- Approval State changes to Approved.

Status: Passed ✓

---

## Test Case 4: Create Task Record

### Objective

Verify that a task record is created after approval.

### Steps

1. Approve the request.
2. Navigate to the Network Task table.
3. Search for the task related to the request.

#### Expected Result

- A new task record is created.
- Task contains request details.
- Task status is set correctly.

#### **Test Case 5: Status Change**

Verify that changing the task status triggers the next flow actions.

#### Steps

1. Open the created task.
2. Change the Work Status.
3. Save the record.

#### Expected Result

- Flow detects the status change.
- Task record is updated.
- Notification email is generated.

#### **Test Case 6: Rejection Scenario**

#### Objective

Verify that the flow handles rejected requests correctly.

#### Steps

1. Submit a Network Request.
2. Reject the approval request.

#### Expected Result

- Approval condition evaluates to Rejected.
- Rejection email is sent.
- Flow ends without creating additional tasks.

#### Testing Outcome

The Network Request Flow was successfully tested in the ServiceNow Personal Developer Instance. All workflow actions, approval processes, conditional logic, record creation, record updates, and email notifications executed according to the designed business process. The testing confirmed that the flow automates the complete lifecycle of a network request from submission through approval and task completion.
